

Encryption Compliance Documentation

****App Name:** UCMeet.Chat**
****Bundle ID:** org.ucmeet.UCMeetChat**
****Developer:** UC.Technology LLC**
****Date:** March 22, 2026**

1. Encryption Usage

UCMeet.Chat is a secure messaging application built on the Matrix protocol. The app uses encryption for:

1. ****End-to-End Encryption (E2EE):**** Messages and calls are encrypted using the Olm and Megolm cryptographic protocols, implemented by the open-source Matrix Rust SDK.
2. ****Transport Security:**** All client-server communication uses HTTPS/TLS.

2. Cryptographic Algorithms

Algorithm	Purpose	Standard
AES-256-CBC	Message encryption (Megolm)	NIST FIPS 197
Curve25519	Key agreement (Olm)	IETF RFC 7748
Ed25519	Digital signatures	IETF RFC 8032
HMAC-SHA-256	Message authentication	IETF RFC 2104
HKDF-SHA-256	Key derivation	IETF RFC 5869
TLS 1.2/1.3	Transport security	IETF RFC 8446

All algorithms listed above are standard, well-known algorithms accepted by international standards organizations (IETF, NIST).

3. Encryption Implementation

The app does ****not**** implement its own cryptographic algorithms. All cryptographic operations are performed by:

- ****Matrix Rust SDK**** (open source, Apache 2.0 license): Provides Olm/Megolm E2EE implementation. Source code publicly available at <https://github.com/matrix-org/matrix-rust-sdk>
- ****Apple Security framework / TLS****: Provides transport-layer encryption via the operating system.

4. Open Source Exemption

The encryption source code used by this application is publicly available and qualifies for the publicly available encryption source code exemption under EAR Section 742.15(b). The Matrix Rust SDK is published under the Apache 2.0 license at the URL listed above.

5. Availability

The app is available to users worldwide through the Apple App Store. It does not restrict encryption functionality based on geography.
